1 About MyWay

MyWay is a screen recorder for the Linux desktop, built for GNOME on Wayland. It records your whole screen or a single window, with sound from the audio input you choose, and saves an MP4 video on your computer.

What MyWay does

- Records the full screen or one window, using the standard Wayland screen-sharing permission dialog.
- Records audio from an input you pick, with a live level meter.
- Encodes video as H.264, H.265 or AV1 at the bitrate you choose, at your screen's own resolution or scaled down to 720p, 1080p or 2160p.
- Saves to `~/Videos` or any folder you choose.
- Keeps a library of your recordings, where you can play, rename and find them.
- Keeps everything local: no telemetry, no uploads.

MyWay is free, open-source software under the GNU Affero General Public License v3 (AGPL-3.0). Source: github.com/TaliskerMan/MyWay.

2 System requirements

Operating system	64-bit (amd64) Ubuntu, Debian, Pop!_OS or a derivative
Session	**GNOME on Wayland** recommended (uses the desktop's screen-sharing portal)
Media	GStreamer 1.22+ with the good, bad and ugly plug-in sets, PipeWire and `xdg-desktop-portal` (installed with the package)
AV1 recording	Also needs the GStreamer SVT-AV1 encoder (`svtav1enc`), included in `gstreamer1.0-plugins-bad` on recent Ubuntu releases
Disk space	Depends on length and bitrate: about 150 MB per minute at the default 20 Mbps

On an X11 session, MyWay falls back to recording through X11 and lets you click a window to record.

3 Installing MyWay

Each release includes `myway_<version>_amd64.deb`, a SHA-512 checksum and a detached GPG signature.

```
sha512sum -c myway_<version>_amd64.deb.sha512
gpg --import chuck_pubkey.asc
gpg --verify myway_<version>_amd64.deb.asc myway_<version>_amd64.deb
sudo apt install ./myway_<version>_amd64.deb
```

`apt` installs the GStreamer, PipeWire and portal packages MyWay needs. Open **MyWay** from your applications menu.

Uninstall: `sudo apt remove myway`. Your recordings in `~/Videos` aren't touched.

4 Quick start

1. Open MyWay and choose **Audio** in the side rail. Pick your microphone (or other input) from the list and speak: the meter should move.
2. Choose **Record**. Under **Select Recording Type**, pick **Full Screen** or **Window**.
3. Click **Record**. GNOME asks which screen or window MyWay may record; choose it and click **Share**.
4. Do what you want to record.
5. Click **Stop**. The video is saved to your output folder (`~/Videos` unless you change it) as `myway_rec_<timestamp>.mp4` and appears in **Library**. GNOME's screen-sharing indicator turns off.

5 Using MyWay

MyWay's side rail has six sections.

Audio

Lists the audio inputs on your system. Choose one and watch the level meter to check it's picking up sound. If none is found, MyWay shows **No Mic Detected**; check your system sound settings.

Record

Control	What it does
Full Screen	Records a whole screen. On Wayland, GNOME's dialog lets you pick which one.
Window	Records a single window. On Wayland, pick it in GNOME's dialog. On X11, click **Select Window to Record**, then click the window.
Record	Starts recording (after you approve the sharing dialog on Wayland)
Stop	Stops and saves the recording

> **Note:** The sharing dialog is part of Wayland's security: no app can see your screen until you allow it. You'll see it each time you start a recording.

Settings

Setting	What it does
Video Codec	**H.264 (AVC)** plays almost everywhere (default). **H.265 (HEVC)** makes smaller files but some players can't open them. **AV1 (SVT-AV1)** is the most efficient but needs the SVT-AV1 GStreamer encoder.
Video Bitrate	2 to 80 Mbps (default 20). Higher means better quality and bigger files.
Recording Quality	**Source (no scaling)** records at your screen's or window's own resolution (default). **Up to 720p / 1080p / 2160p** scales larger sources down to that height, keeping the shape. MyWay never scales up, so a 1080p screen stays 1080p under "Up to 2160p".
Output Folder	Where recordings are saved. Click the folder button to choose another folder in your desktop's folder chooser; the reset button returns it to `~/Videos`.

Video is encoded in software on the CPU (x264, x265 or SVT-AV1); MyWay doesn't use hardware (GPU) encoding. Audio is AAC, in an MP4 file. Frame sizes are rounded to even numbers (for example a 1001 × 803 window records at 1000 × 802), which the encoders need.

Library

Lists the recordings in your output folder. For each one you can:

- **Play Recording** in your default video player,
- **Rename** it,
- **Open Directory** to show it in your file manager.

To delete a recording, delete the file in your file manager.

Support

Diagnostic logging for when something goes wrong:

1. Turn on **Enable Debug Logging**.
2. Reproduce the problem.
3. Click **Export Logs & Contact Support**. MyWay saves `MyWay_Logs.tar.gz` to `~/Downloads` and opens an email to support@nordheim.online in your mail app. Attach the archive before sending.

Refresh Logs shows the latest log lines in the window.

About

Version, license and credits.

6 Privacy and security

- MyWay has no telemetry and makes no network connections. Recordings and logs stay on your computer.
- On Wayland, screen access goes through GNOME's screen-sharing portal, which always asks you first.
- The screen-capture handle is passed between MyWay's components through a private socket in your user runtime folder, readable by you only.
- Logs are only written when you turn on debug logging, and only sent if you choose to email them.

7 Limitations

- **Area recording** (a custom rectangle) isn't available from the interface in this version.
- **Software encoding** uses the CPU. At high bitrates or on slower computers, choose H.264 and a lower bitrate if recordings stutter.
- **AV1** needs the SVT-AV1 GStreamer encoder, which may not be installed by default.
- **H.265 files** don't play in every player or browser; use H.264 for sharing.

8 Troubleshooting

The sharing dialog never appears / recording fails at once. Make sure you're on a Wayland session with `xdg-desktop-portal` and `xdg-desktop-portal-gnome` installed. On X11 or other compositors, full-screen portal capture may be unavailable; MyWay tells you so.

No sound in the recording. Check the input in **Audio** (the meter should move) and that it isn't muted in system settings.

AV1 recording won't start. MyWay says it couldn't start the AV1 encoder. Install the SVT-AV1 GStreamer plug-in, or switch to H.264.

"Recording stopped unexpectedly". The recording hit an error partway through, for example the disk filled up or the output folder was removed. What was recorded may be incomplete. Turn on debug logging in **Support** and try again to see the cause.

The folder chooser doesn't open. Choosing a folder needs `xdg-desktop-portal` 1.12 or newer with a desktop backend such as `xdg-desktop-portal-gnome`.

The video won't play on another device. Switch the codec to H.264.

I need help. Use **Support → Export Logs & Contact Support**.

9 Support and license
